

# SOS SIREN MODULE

## CONTROL ANY SIREN, ANYWHERE

### DON'T LET A CRISIS BECOME A CATASTROPHE

The SOS Siren Module provides direct two-way controls with native Whelen protocols to any Whelen siren. The SOS Siren can also merge with third-party sirens where the protocol is available or be retrofitted with the CentrAlert Secure Communications Remote Terminal Unit (SCRTU). The SCRTU is then activated with the CentrTalk protocol, allowing a common interface to multiple manufacturers.

This adaptability to a variety of siren setups means that the SOS Siren Module lets you quickly alert your affected areas using new or existing sirens. On top of this, the best-in-class scalability of the SOS Siren Module allows users to control both outdoor, community-wide systems as well as smaller, indoor facility systems, making it ideal for any organization.

Status Request commands provide full system diagnostics which include Amp Failure, Low Battery, Intrusion, Communications and more. Siren devices may also be saved into groups for zoning or administrative purposes while devices may also be saved to the system map via icon drag-and-drop or with geo-location coordinates.

#### Operational Features

- Click-and-select siren activation
- Single, group or total zone activation
- Configure and control siren attributes
- Supports live or pre-recorded messages as well as voice capable sirens
- Record and store messages in real time from your desktop
- Full test features
- Supports DTMF, FSK and other protocols
- Monitor all system functions and alarms
- Auto calculate system availability and immediately notify maintenance personnel of any system alarms
- Full reporting and alarm modules included
- Affected population option
