

WEATHER NOW!

THE FULLY-CUSTOMIZABLE CAP ALERT INTERFACE

PROACTIVELY MITIGATING SITUATIONS IN REAL TIME

Part of our suite of Adaptive Intelligent Controls, Weather NOW!™ allows the CentrAlert C-DAC to automatically send preset weather crisis warning messages to specific people via any communication channel. Using C-DAC's Common Alerting Protocol (CAP) module, this fully-customizable feature allows emergency management directors the flexibility to compose specific responses to different National Weather Service (NWS) and National Oceanic and Atmospheric Administration (NOAA) events.

All event types are recognized and are user-configurable to automatically trigger a single action or multiple actions. The full suite of CentrAlert notification devices is available for information or alerting, allowing the user to target the general public, specific groups or individuals with default or custom messages.

Operational Features

- Send targeted weather warning alerts via text, email, pop-up, voice call or social media
- Ability to communicate with physical communication channels like sirens, message reader boards, strobes and more
- Target alerts by GPS coordinates, FIPS code or map data
- Supports all Emergency Alert System (EAS) events
- Send targeted "All Clear" alerts after any major weather event
- Available modes include Automatic (which requires no human interaction) and Manual (which provides prompts to the operator)
- All data comes directly from NWS or NOAA, without relying on third-party interfaces
- Ability to pair with Advisor Alert Radio for localized control of escalating events
