

# LIVE ALERT PROTECT

PROTECTING YOUR ORGANIZATION  
FROM FALSE LIVE ALERTS

## PREVENTING AN ACCIDENTAL ALERT FROM CAUSING A CRISIS

Live Alert Protect prevents your organization from accidentally sending out a false live alert. When an operator begins to initiate a live alert, the preview screen displays the message that will go out and produces a unique four-digit code. Before the live alert can be sent, the operator must type in the code. The code (which is not a password) appears on the screen and the operator simply needs to type it in the blank space. Emergency managers can choose to turn Live Alert Protect on or off.

Live Alert Protect does not require the operator to type the code for test alerts. The quick additional step makes the operator extra aware that he or she is about to send a live alert.

### Operational Features

- Code-Protected Emergency Alerts
- Four-Digit Code Appears as Final Step before Activation
- Code Feature Can Be Turned On or Off
- No Code Requirement for Drills or Test Alerts

### Other CentrAlert Adaptive Intelligent Controls

- Dam Breach Detect
